

About ePostRx Standard

ePostRx Standard™, the ANSHealth flagship product, was designed for those companies (such as Physician, Clinic, Point Of Care (POC) vendor, Hospital) that operate in a closed network searching for an alternative solution to pricy transaction-fee based prescription delivery solutions. Because ePostRx Standard™ provides the tools required to connect, manage and monitor electronic prescription transactions between healthcare partners, companies can now extend into any segment of electronic pharmacy effectively meet the growing demand for patient prescriptions. Best of all, because ePostRx Standard™ is designed as a client side-plug-in, it does NOT require the replacement of your current pharmacy infrastructure.

Our flagship product provides all the necessary client/server components to control and manage the transfer of SCRIPT messages between healthcare partners. Client toolkit provides low-level programmatic control of secure message communication with the ePostRx server. Toolkit can be embedded into business applications and transactions monitored by the ePostRx Management Console web portal.

Don't pay costly transaction fees! If you know your healthcare partners or operate in a closed network such as a clinic or Hospital, then get your business connected with ePostRx Standard™!
